About this document

This document and any other document in association aims to outline envisions of the business concept and platform design for the InsurAce project, a new decentralized insurance platform underpinned by BlockChain technologies and DeFi philosophies.

The business proposal set out in this document is based on the prospect of the evolving digital era we envisage, as well as certain assumptions and information currently available and deemed reliable to us, subject to possible updates from time to time. Due to the nascent nature of DeFi, the views stated in this document are representative of the business ideas of our team solely, and do not constitute any investment suggestion to any digital asset, or explanation of the policies or opinions of any government or authority. References to certain specific industry terms, company names, or platforms trademarks, are for illustrative purposes only, and do not imply any affiliation with, or endorsement of any of those parties.

1 Executive Summary

In this paper, we propose InsurAce, a new decentralized insurance protocol, to empower the risk protection infrastructure for the DeFi community. InsurAce offers portfolio-based insurance products with optimized pricing models to substantially lower the cost; launches insurance investment functions with SCR mining programs to create sustainable returns for the participants; and provide coverage for cross-chain DeFi projects to benefit the whole ecosystem.

2 Introduction

2.1 DeFi Landscape

Decentralized Finance (DeFi) aims to offer financial services by leveraging the decentralized technologies, mainly public blockchain networks, in an open and transparent manner with universal accessibility. It has been at the forefront of innovations in the blockchain and crypto currency space since 2019, and exploded in 2020 with various projects blossomed. The total value locked (TVL) in DeFi has boomed in the past few months, which, as of Nov. 2020, has surpassed US\$14.35B¹, and the number of monthly active users has hit a new high of 300,000 in Sept. 2020.

Figure 1 DeFi TVL Trend (from DeFi Pulse)

2.2 Market Demand

Since the inception of cryptocurrency, cyber security hack has been one the biggest

¹ <https://defipulse.com/>

challenges and threats to the industry. There are quite a few infamous and shocking attacks to the crypto space, such as the Mt. Gox hack back to 2011-2014 causing US\$460M loss, the NiceHash hack in 2017 causing US\$64M loss, the Bittrex hack in 2018 causing US\$18M loss and etc., which have been shaking the foundation of the crypto world.

With the advent of DeFi, the cyber security issues come along. There are 15 publicly reported security hacks to the DeFi community since the 2nd half of 2019, including attacks to some well-known protocols, causing US\$113.26M loss in total (refer to table [1]).

S/N	Time	Protocol	Loss (US\$M)	Exploits Description
1	22-Nov-2020	Pickle Finance	20.0	Code flaw in smart contract
2	14-Nov-2020	Value Protocol	6.0	Flash loan attacks
3	13-Nov-2020	Akropolis	2.0	Flash loan hacks
4	7-Nov-2020	Origin Protocol	7.0	Code flaw in smart contract
5	26-Oct-2020	Harvest	25.0	Flash loan attacks
6	14-Sep-2020	bZx	8.1	Code flaw in smart contract
7	6-Sep-2020	SYFI	0.25	Software bug
8	4-Aug-2020	Oryn	0.37	Double spend attack
9	28-Jun-2020	Balancer	0.50	Wrong price caused by oracle defect
10	19-Apr-2020	LendF.me	25.00	ERC777 token standard reentrancy attack
11	18-Apr-2020	imBTC Uniswap Pool	0.30	ERC777 token standard reentrancy attack
12	12-Mar-2020	Maker	9.00	Human manipulation
13	18-Feb-2020	bZx	0.64	Oracle manipulation (suspected)
14	15-Feb-2020	bZx	1.00	Flash loans and oracle manipulation
15	30-Jul-2019	Synthetix	8.1	Wrong price caused by oracle defect
Total Loss			113.26	

Table 1 Summary of DeFi Hacks

Needless to say, the cyber-attacks have been posing significant threats to the whole DeFi ecosystem fundamentally. Besides the technical approaches to resolve this problem, insurance, by its nature, has been another effective means to manage this risk.

However, by taking a deeper look at the current DeFi landscape, insurance products still remain scarce. According to the data from DeFi Pulse, there are only 3 notable insurance protocols available out of the 100 major DeFi projects been selected, i.e., the Nexus Mutual, Oryn and Augur.

Number Of DeFi Projects

Figure 2 Distribution of DeFi Projects

Nevertheless, the overall DeFi TVL been covered is extremely low by the existing insurance projects. According to the data disclosed by Nexus Mutual², the total value covered is US\$246M at its peak, which occupies merely around 2% of all asset across the landscape.

Figure 3 TVL in DeFi Covered

On the one hand, the DeFi space has been developing rapidly. On the other hand, the cyber risk has also been growing continuously. The market is calling for more insurance products to safeguard the whole ecosystem.

² <https://nexustracker.io/>

2.3 Existing Challenges

We did extensive research on the existing insurance products, they are designed in different ideas and methods which can be categorized into 3 types with further comparisons listed in table below:

- Mutual insurance, such as the Nexus Mutual;
- Financial derivatives, such as the Oyn (convexity protocol); and
- Prediction market, such as the Augur.

Element	Mutual Insurance	Prediction Market	Financial Derivative
Product	Nexus Mutual	Augur	Oyn
Capital and Liquidity			
Common Capital Pool	Yes	No	No
Fully Collateralized	No	Yes	Yes (Nearly Always)
Liquidity	Customer to Pool	Two Sided Market	Two Sided Market
Flexibility			
New Products	Low	High	High
Risk Coverage	High	High	High
Claim Assessment	Voting	Voting	Not Required
Pricing			
Extreme Risk	Good	Not so good	Not so good
At the Money Risk	Not so good	Good	Good

Table 2 Existing Insurance Products Comparison

In spite of the development of existing DeFi insurance projects, we note that mutual is still the mainstream of DeFi insurance, however there are still a few common issues that need to be addressed.

(1) Limitations of Product Accessibility

There are some limitations on product accessibility for existing products, such as:

- High premium: especially for the protocols with less staked pool;
- KYC-based membership: which contradicts the free and open ethos of DeFi;
- Limited cover capacity: which often frustrates customers when they need to buy covers for their intending protocols;
- Lack of coverage for new protocols: which is often lagged behind the industry pace and unable to support the latest protocols;
- No cross-chain coverage: which limits the protection capability to DeFi protocols on other public chains;
- Lack of protection diversity: which is limited to cyber security protection only compared to the wide coverage of risk types in traditional insurance

landscape;

(2) Lack of Underlying Risk Management

Risk management lies at the core of any insurance business, however current DeFi insurance products still have a lot of room to enhance their risk control capabilities, such as:

- Cyber security of the insurance protocol per se: what if the insurance platform itself is hacked?
- Concentration risk: the capital pool is often highly concentrated on a few major protocols, and the platform is solely relying on Ethereum;
- Claim assessment: the existing claim assessment is handled in a gross manner with a Yes/No judgement only, without quantified evaluation of the loss;
- Operation / Credit / Market Risk evaluation: those risks are not well evaluated and taken into account for the platform design and operations.

(3) Capital Inefficiency

Capital efficiency constitutes the cornerstone for any insurance company, which benefits both the insurers and the insured in a systematic manner. However, low capital efficiency is another pain point for existing DeFi insurance products, such as:

- Low reserve utilization: the capital injected into the insurance platform is often not well managed, leading to the low utilization of the reserved fund which can be employed in a more delicate way;
- Unsustainable investment return: similar to traditional insurance business, customers are always expecting to gain sustainable investment return on the money they place into the insurance company.

We have seen the market demand for more insurance projects to enhance the risk management infrastructure of the DeFi ecosystem, as well as seeking for improvements to address the abovementioned challenges. Therefore, we would like to propose this solution, the InsurAce protocol, with core value creations stated as below.

2.4 Core Value Creations

While we acknowledge and respect the leading role of Nexus Mutual as the pioneer of DeFi mutual insurance, we would like to build InsurAce as a mutual insurance protocol but with some distinctive value propositions. We do not consider ourselves as the competitor, but more of a healthy and necessary complementary role to the immense and expansive DeFi world.

(1) “0” Premium

With the portfolio-based product design as a fundamental approach of risk diversification, the premium for the insurance product will be reduced by its nature.

InsurAce has also developed unique pricing models to optimize the cover cost leveraging on the expertise from insurance experts. Furthermore, the investment utilities will complement the cover cost to offer ultra-low premium, which is close to Zero at its best.

(2) Enriched Product Line

Unlike the single protocol based insurance coverage in Nexus Mutual, InsurAce will uniquely offer portfolio-based insurance product to enable coverage on a basket of DeFi protocols, which will create a diversified risk management tool for the DeFi investors.

Despite the fact that Ethereum is the dominating public blockchain for DeFi protocols, other public blockchain is also stepping in with booming DeFi projects. InsurAce will offer products to cover those non-Ethereum DeFi protocols as well to benefit the decentralized space as a whole.

InsurAce plans to expand the product accessibility to a wider audience by removing the KYC process. Anyone with a digital wallet will be able to connect with the platform and fairly use the services such as buying cover, staking asset, making claims and etc.

(3) SCR Mining

Another distinctive feature for our token economy is our SCR mining programs. The participants will be able to earn the InsurAce Token (INSUR) by staking into the liquidity pool.

The mutual capitals injected through staking will be managed with rigorous risk control models to dynamically adjust the Solvency Capital Requirement (SCR) and use the secured free capital for investment, whereas the mining speed will be controlled accordingly.

(4) Sustainable Return

The low investment return has been a major challenge for Nexus Mutual since its capital return for the capital pool providers are sliced from the premiums, which is quite low compared to the benchmark yield on lending and borrowing platforms such as Compound and Aave. Such low return will in turn impede the capital injection into the capital pool, and worsen the issues such as high premium and limited capacity.

On InsurAce, customers will be able to gain returns in many ways, including: i) invest directly in the investment products per their risk appetite; ii) stake in the mutual pool to get the investment carry and InsurAce Token (INSUR) as rewards; iii) enjoy shares of the premium income. We believe such design will benefit both the insured and insurers in a sustainable way.

(5) Further Improvements

Some of the processes will also be refined to better cater customer needs, such as:

- Handle claim assessment quantitatively instead of simple Accept or Reject;

- Provide extension, incremental or transfer capabilities to existing covers;
- Collaborate with other DeFi protocols to form an ecosystem to provide cross insurance, insurance syndication and etc. to benefit InsurAce customers;
- Insurance coverage marketplace.
- Expand coverage to more specific risk types such as oracle malfunction, asset volatility, flight delay, disaster and etc.

3 Solution Overview

3.1 Business Model

As an insurance protocol, InsurAce will provide two function arms similar as the traditional insurance company, i.e., the insurance arm and investment arm. The free capital in the insurance capital pool can be placed into the investment pool to gain higher yield, while the insurance arm will provide protection to the investment activities. Meanwhile, the yield at the investment side will in turn complement the premium at the insurance side, and further reduce the cover cost for customers. These two parts will in such a synergetic manner to provide “0” premium insurance as well as considerable investment return, forming a sustainable business model.

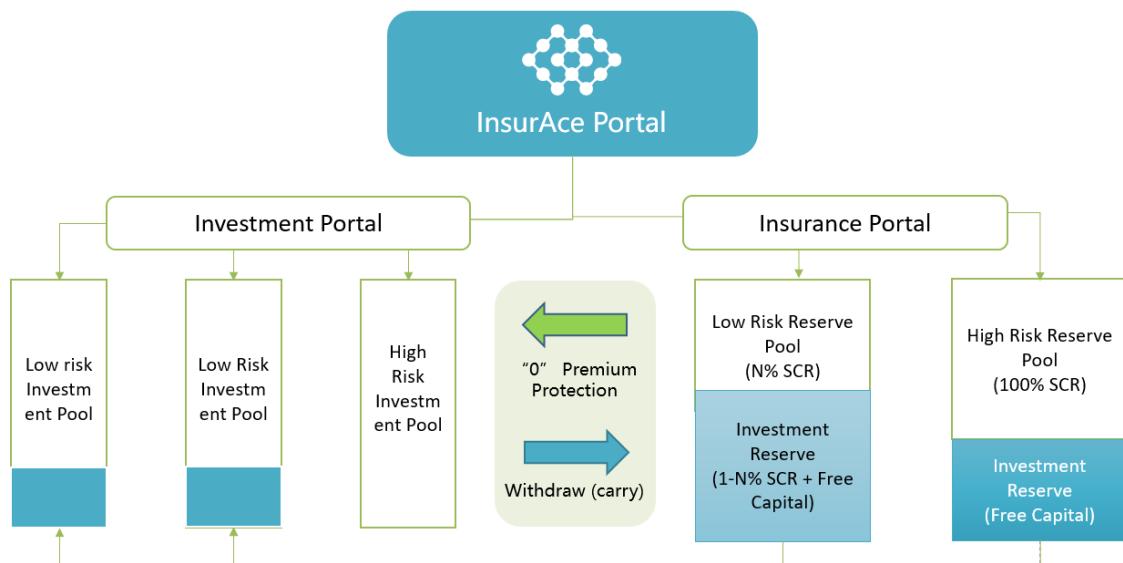

Figure 4 Business Model Design

In this model, InsurAce as a platform, will generate revenues from the insurance premium as well as a minor portion of carry from the investment returns. Those revenues will be used in areas such as operation / development costs, tokens buybacks, community incentives, ecosystem collaborations and etc.

3.2 Use Case

There are many use cases on the InsurAce protocol, we will introduce three most typical cases for common InsurAce users and one platform level use case to further illustrate how InsurAce works.

(1) Investor

As an investor, Bob invests asset via investment portal by choosing the investment portfolio with different risk and return appetite. His investment will be covered by an almost “0” cost insurance and he will gain investment returns and INSUR token as incentives

(2) Mary as an Insurer

As an insurer of the mutual, Mary stakes assets into the mutual insurance pool, gains INSUR token as incentives according to the SCR mining and investment returns.

(3) Jack as an Insured

As an insurance customer, Jack accesses through the insurance portal to buy single or multiple insurance covers, get INSUR tokens as incentives and request for claims when the policy is triggered.

(4) Synergy between the two Arms

Investors, insurers and insured will all benefit from the interactions between the investment and insurance arms at the platform level.

- The insurance arm provides coverages to the investment arm;
- The free capital in the insurance pool will be used for investment managed by the investment arm;
- The investment yield will be returned to the insurance side to incentivize the insurers and insureds.

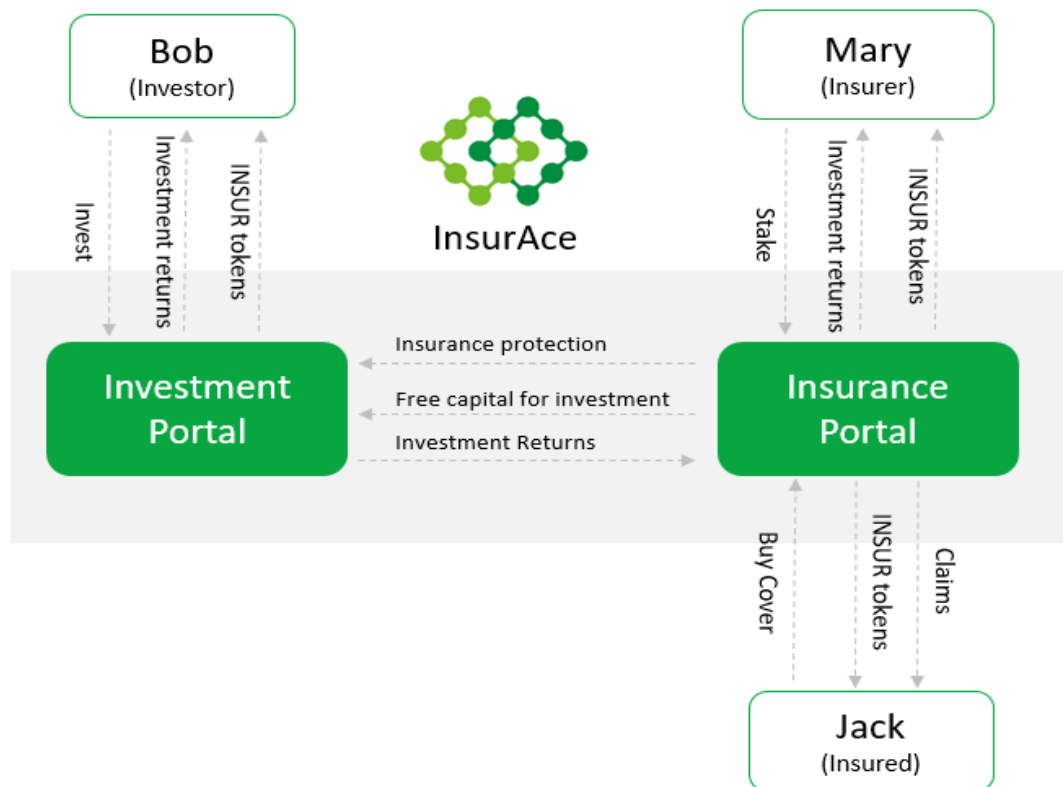

Figure 5 Use Cases

3.3 Key Components

Based on the major use cases, the InsurAce protocol will comprise of eight key components, including:

- Products: to provide enriched product line;
- Capital Provision: to inject liquidity into the mutual pool and investment vaults;
- SCR Mining: to manage the capital pool according to capital requirements and control the speed of liquidity mining;
- Investment: to generate investment yield for customers and further lower cover cost.
- Pricing Models: to design professional pricing methodologies to effectively lower the cover cost;
- Risk Management: to evaluate the risk of protocols on-boarded as well as manage the whole risk of the platform;
- Claim Assessment: to handle the claim requests from the cover buyers;
- Governance: to adopt DAO as the primary governance mechanism for product development, claim assessment, community proposals, token distribution etc. Meanwhile, we'll also convene an Advisory Committee to handle the exceptions the contingency plan to safeguard the insurance business.

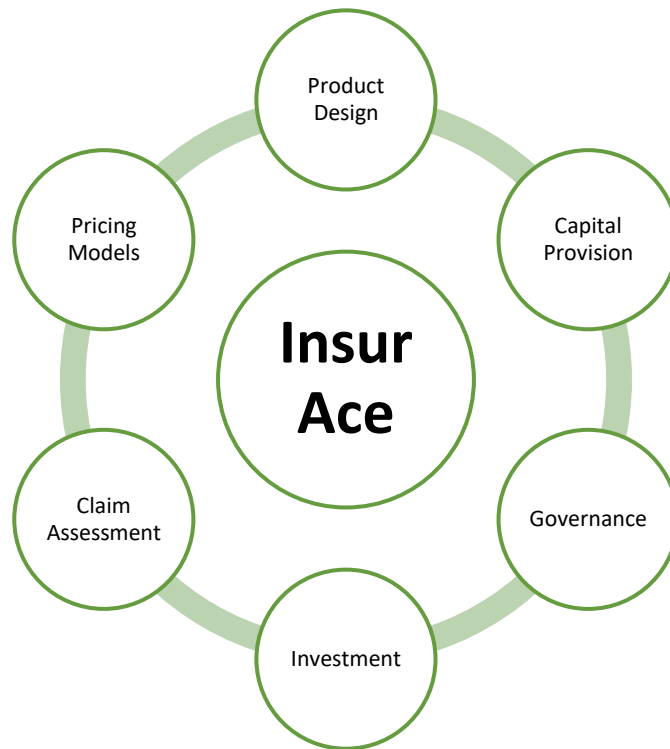

Figure 6 InsurAce Key Components

3.4 Architecture Design

The platform will consist of four layers, including:

- User Layer, to provide the user access functions for platform users such as cover buyers, investors, risk assessors and etc.;
- Operation Layer, to cover the various user or business operation scenarios interacting with core product functions;
- Products Layer, to build the core functions of the platform, such as product offering, liquidity pool, investment, pricing models, governance, etc.;
- Infrastructure Layer, to set up the interactions with Ethereum network as a base, and maintain interoperability with external oracles and cross chain utilities.

Below is a diagram of the architecture design of the platform.

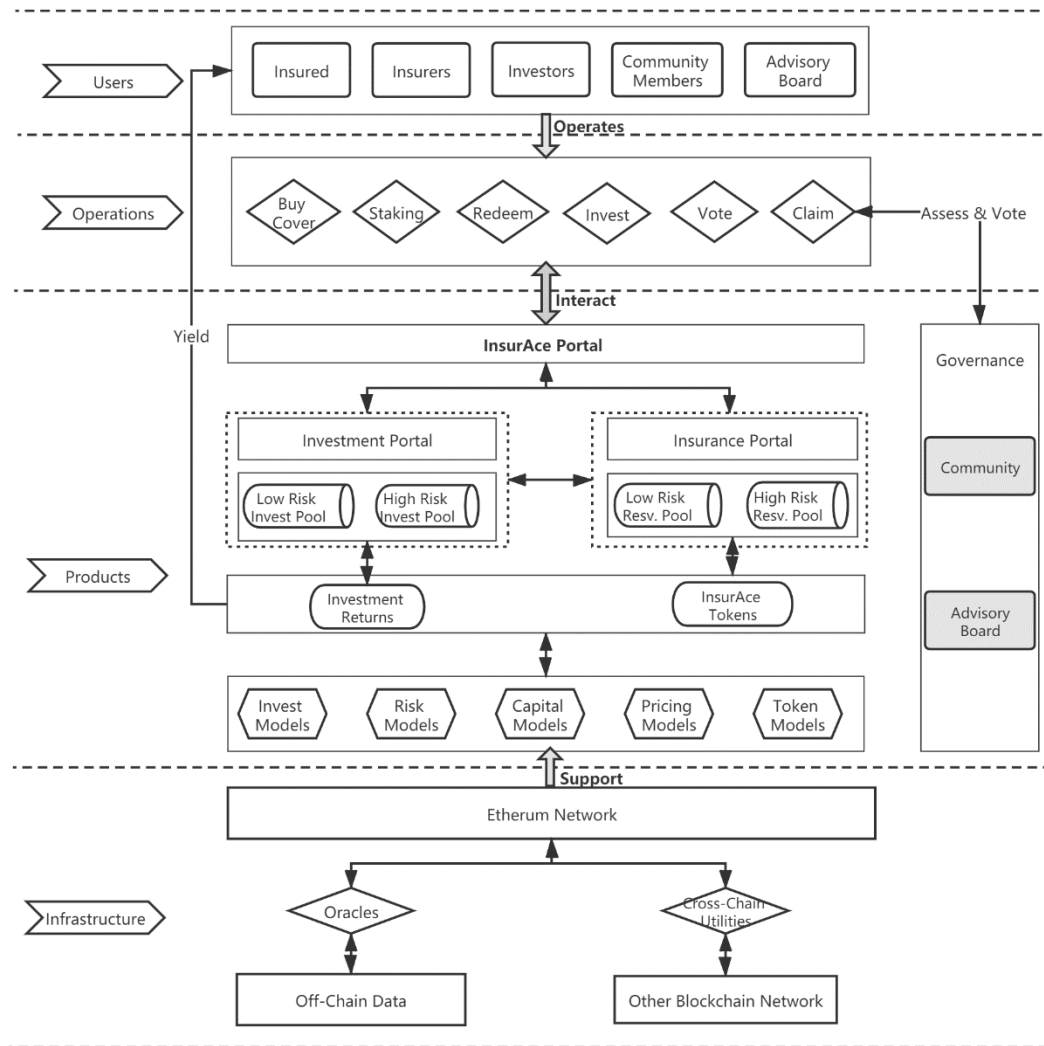

Figure 7 Platform Architecture Design

4 Core Features and Designs

4.1 Permissionless

Unlike the Nexus Mutual platform where membership registration requires KYC process, which adds the complexity of centralized finance regulations, InsurAce platform will not require such KYC process, thus enable the platform reach to a wider audience. An ERC20 token, the InsurAce Token (INSUR), will be issued as governance and utility token in InsurAce ecosystem.

4.2 Products

The InsurAce platform will provide covers on smart contract cyber threats at the start which is the most demanding in current DeFi space.

Unlike other single protocol based platform where capital pool and cover purchase is per protocol, InsurAce will adopt the portfolio-based design to pool all injected mutual funds into one pool and provide multiple protocol protection together. Basically, we plan to offer the covers in two approaches:

(1) User Defined Portfolios

When customers enter the Insurance Portal, they may choose one or multiple protocols as a portfolio to get a quotation and place the order, which is flexible and direct.

(2) Off-the-shelf Portfolios

To facilitate the customers, InsurAce will also provide some off-the-shelf product portfolios categorized by different criteria, such as:

- By protocol business type: a portfolio product to include the major protocols in Lending, or Decentralized Exchange (DEX), or Oracles and etc. so that customers can cover the risks of a business sector by one product;
- By protocol risk level: there will be an open risk assessment methodology to give a risk score for each protocol on-boarded, and a portfolio product that covers the same risk level protocols can be bought in one go.

At the start of platform launching, InsurAce will carefully select a list of protocols to be listed and offered. To on-board a new protocol subsequently, it will be mostly based on proposals from the community and subjected to community voting, in which the risk assessment methods as set out in section 4.5 will be employed to form a risk score for the protocol and be accounted into the pricing process.

Along the way, other types of risks such as asset volatility, flight delay, disaster and etc. will also be considered to enrich the product basket and enable a more comprehensive coverage.

4.3 Capital Model

The business model of the insurance industry, including insurance and reinsurance, is about taking risks, mutualizing risks, managing risks while remaining solvent, and profitable, in which capital model defines the capital required to cover the risks associated with such purposes.

The capital model adopted by InsurAce is referred to the EIOPA's Solvency II, which is the prudential regime for insurance and reinsurance undertakings in the EU. It sets out requirements applicable to insurance and reinsurance companies with the aim to ensure the adequate protection of policyholders and beneficiaries.

At the core of the new regulatory framework Solvency II is an economic risk-based approach, which should enable the assessment of the "overall solvency" of insurance and reinsurance undertakings through quantitative and qualitative measures. Under Solvency II, the solvency requirements for the undertakings are determined on the basis

of their risk profiles and on the way in which such risks are managed, therefore providing the right incentives for sound risk management practices and securing enhanced transparency.

There are different tiers of capital requirements under Solvency II, among which the Solvency Capital Requirement (SCR) and Minimum Capital Requirement (MCR) are the two key criteria. The SCR is the capital required to ensure that the insurance company will be able to meet its obligations over the next 12 months with a probability of at least 99.5%, where MCR represents the threshold to correspond to an 85% probability of adequacy over a 12 months and is bounded between 25% and 45% of the SCR. For supervisory purposes, the SCR and MCR can be regarded as "soft" and "hard" floors respectively.

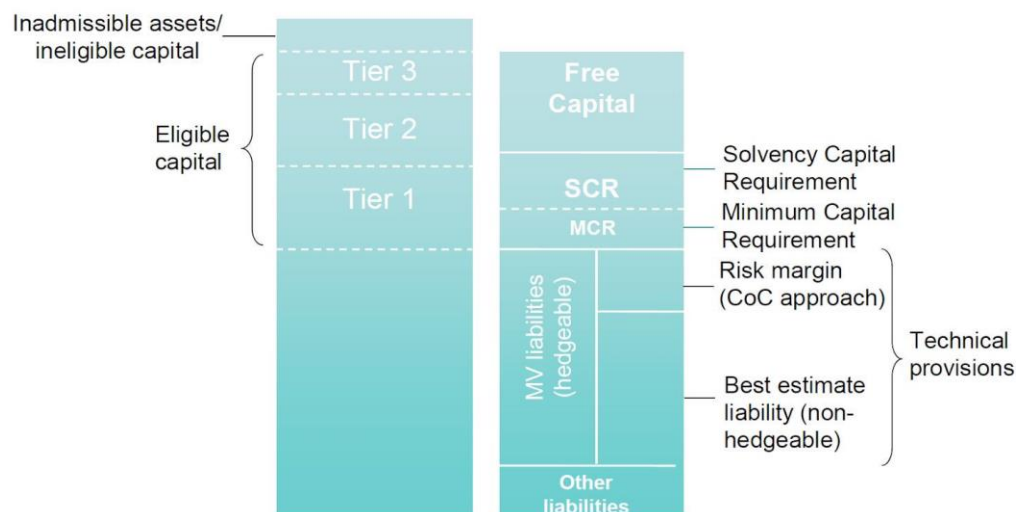

Figure 8 EIOPA's Solvency II Capital Model

Mathematically, SCR is made up of:

$$SCR = Technical Provision + Additional Funds$$

The first item is actually the discounted best estimate of all future cash flows, namely, the expected claim losses and other expense minus future premiums receivable. In our case, the discounted best estimate (DBE) for a portfolio will be equal to

$$DBE = \theta_1 \times SBC + \theta_2 \times EL$$

Then, the overall DBE can be formulated as follows, which is to cover the whole underwriting

$$DBE_{all} = \sqrt{\sum_{i,j} Corr(i,j) \times DBE_i \times DBE_j}$$

where $\text{Corr}(i,j)$ is correlations between each pair of Contracts.

The additional funds (AF) are reserved for the loss caused by "long tail" losses, which is calculated as follows,

$$AF_s = RF \times \sqrt{\sum_{i,j} \text{Corr}(i,j) \times CA_i \times CA_j}$$

where $RF \in (0, 1)$ is risk factor to scale the capital and CA_i is the Cover Amounts for individual portfolio i .

To operate with high standards of security, InsurAce will adopt SCR as the primary capital requirement which is more rigorous than existing platforms. The Free Capital excessive to the SCR in the capital pool will be used for investment in the investment arm of InsurAce to generate return for our participants, and reduce the cover cost as a whole.

4.4 Pricing Model

The insurance industry is largely an endeavor of hedging against uncertain future loss, in which the insured trade risks with the insurers by premiums via insurance contracts. Therefore, the pricing of insurance products lie at the core of any insurance business, and InsurAce has its unique offerings here as well.

Most pricing models in current blockchain-based insurance communities heavily rely on the value staked on individual protocols: the higher value staked for the specific protocol, the lower premium will be priced. This staking driven pricing structure fails to assess the real risk of each protocol and is very likely to significantly over-estimate the premium of those less staked protocols.

To substantially mitigate this issue, InsurAce will adopt new actuary-based pricing models to fairly assess the expected loss of insurance products, and thereby reduce the cost and enhance the capability.

The loss assessment is conducted on the portfolio level, which will consolidate portfolio level actuarial pricing and constituents' risk scores for each individual protocol involved in the portfolio.

Figure 9 Mechanism of Portfolio-based Pricing

We will follow the key ideas of Aggregate Loss Distribution model in actuarial science to estimate the expected loss in portfolio level. The modelling workflow is illustrated in figure 11 below.

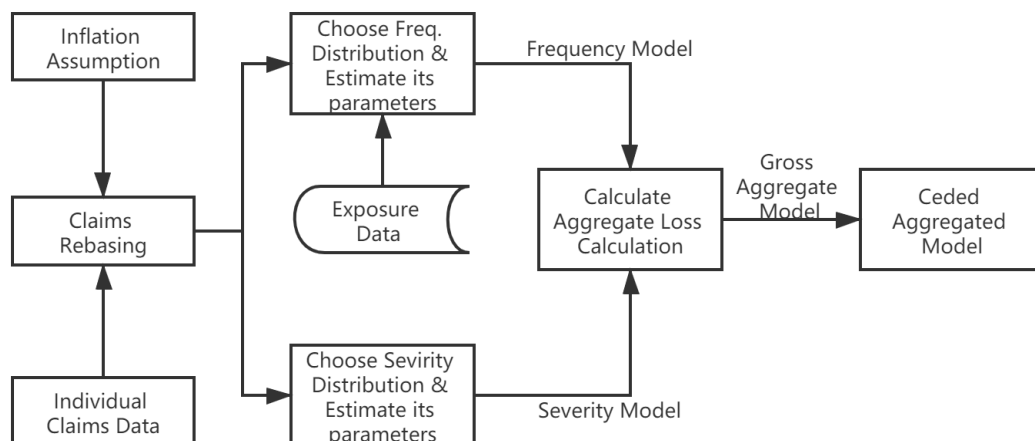

Figure 10 the Workflow of Aggregate Loss Assessment

The main inputs for the modelling are number/amount of claims and number/amount of exposures in a given time window, which will be used for selecting and training two separate models - frequency model and severity model. Frequency modelling is the production of a model that calibrates the probability of a given number of losses occurring during a specific period, while severity modelling is to produce the distribution of loss amounts as well as set the level of deductible and limit of cover amount. When both models have been well estimated, we will combine them to solve the problem of aggregate loss.

Once the aggregate loss is decided, we can incorporate in the risk factors of protocols,

and formulate the final premium calculations.

The parameters of the models will rely on historical data to devise and validate. At the start of the platform, the parameters will be carefully selected and defined, and constantly refined with the accumulation of new data. Along the way, we will also adopt new Machine Learning methodologies to fine tune and optimize the models and parameters.

4.5 Risk Management

Risk management is a key to ensure sustainable business model on InsurAce and guarantees the return on investment and protection. InsurAce introduces a three-step risk assessment approach for investment and protection protocols and bucket them into different risk categories.

(1) Expert Assessment

The InsurAce Advisory Board will perform preliminary risk assessment on the new protocols at first with their expertise from relevant dimensions such as:

- Auditing reports of the protocol;
- Code analysis;
- Founding team qualifications;
- Operation track records;
- Relevance to existing hacked cases;
- etc.

Meanwhile, InsurAce will also work with the professional security auditing firms to seek for their support should there be extra complexity or challenges in due course.

After this, the Advisory Board will provide an assessment report and recommended risk score (1 to 5) as the reference for the community.

(2) Community Assessment

After the Advisory Board assessment, the protocol to be listed will also need to go through a community driven risk assessment which will be conducted by volunteered community members to further evaluate and get a risk score. The members who participate in this process will get INSUR tokens as incentives.

With the above two steps, a final risk score will be given to the protocol.

(3) Continuous Update

Once the protocols is listed, we will employ the preparatory risk models to continuously evaluate risk level by collecting data and information of the given protocol, such as the staking changes, the claims to the protocol, correlation analysis to new security incidents, and etc. Such updates will be reflected into the existing risk model and

provide up-to-date risk assessments.

Based on above risk assessment, protocols are bucked into different risk categories to construct investment or insurance staking pool with different return.

4.6 Investment Management

In the traditional insurance industry, the insurance company will use the funding from clients to invest in other financial products to generate returns for the clients. Similarly, InsurAce will also carefully use the free capital secured from the SCR to invest in other DeFi products to gain investment return.

InsurAce will build an investment function similar as Yearn Finance, to design and implement the effective strategies. Customers can either directly invest via the InsurAce Investment Portal, or earn passive income with the free capital staked via the Insurance Portal. The built-in insurance capabilities will be able to seamlessly provide protections over the DeFi protocols invested, and the investment return will in turn complement the insurance customers, which creates a secure and sustainable investment cycle holistically.

Some potential investment plans that InsurAce investment will consider are as below:

- Yield farming on audited protocols and find the profitable investment paths;
- Stake the funds with lending platforms such as Compound to earn interests;
- Stake the funds in DEX such as Uniswap to earn the profits of liquidity providers;
- Other eligible investment strategies.

Any and all investment yields by right shall be returned to the customers, however a minor portion of it might be used to cover the transaction / operation cost, and other potential expenses incurred therein.

4.7 Staking and SCR Mining

Participants who stake capital into the platform will get INSUR as incentives, also known as mining, which is adopted by many other DeFi projects such as Curve, YFI, Sushi Swap, etc.

Since InsurAce has both Insurance and Investment arms where customers will stake capital at both sides, the INSUR tokens will be mined together controlled by below equation.

$$Speed(Investment) + Speed(Insurance) = C;$$

where C is a constant determined by the token economy adjusted over time.

This equation will create a delicate balance between the Insurance and Investment functions. When the insurance capital pool faces insufficiency which will pose higher

risks and lift the premium, the mining speed at Insurance side can be increased to attract more capital to the insurance pool. Similarly, once the capital pool at Insurance side is sufficient, the mining speed at Investment side can be increased to attract more investment funds. This balance is driven by SCR mining mechanism at a lower level.

SCR mining is to dynamically adjust the mining speed among the insurance capital pools according to the capital sufficiency status represented by the SCR ratio, incentivizing more capital staking to the less staked pools represented by the SCR ratio, which will help to reduce the premium on those new or high risk protocols as a whole. The mining speed will be back to normal when SCR ratio is equal or above platform defined SCR ratio.

Specifically, assume S_i is the number of tokens staked in an insurance capital pool at time t , S_{max} is the number of tokens staked in the largest pool at $t-1$ whose mining speed is $Speed_{min}$, then the mining speed for pool i will be calculated by,

$$Speed_i = \begin{cases} Speed_{min} & \text{if } S_i \geq S_{max} \\ Speed_{min} \times \lambda(1 - S_i/S_{max}) & \text{if } S_i < S_{max} \end{cases}$$

where λ is the speed scale, e.g if $\lambda = 2$, the maximum mining speed will increase by 200% from standard speed.

4.8 Claim Assessment

The claim assessment will heavily rely on community claim assessors and the Advisory Board. The assessors will need to meet a minimum requirement of stake. Instead of the simple Accept / Reject result of claim assessment on other platform, InsurAce will introduce a quantitative method to handle the claim in a more delicate manner.

When InsurAce receives a claim application, the Advisory Board will investigate into the matter and propose a claim amount. For example, 0% represents a reject on the claim, 100% represents a full compensation, and other ratio between 0% and 100% represents a partial compensation.

After the proposal is submitted to the community for DAO based decision making, there is a waterfall to run for the final outcome.

- 1) The proposal will firstly be subject to voting by the community members with staking in the insurance pool. Let us assume the threshold to reach a consensus is 75%, the assessment outcome will be determined if the consensus is reached with Accept or Reject.
- 2) If 1) fails to reach a consensus, the proposal will be subject to the voting of community members with INSUR token holdings, no matter they have staked in the insurance capital pool or not. The outcome will be settled once a consensus is reached.

- 3) If 2) still fails, the proposal will be determined at the sole discretion of the Advisory Board to provide the final result.
- 4) Once the above processes are rolled out with an outcome, InsurAce will issue the claim to the applicant and all data will be disclosed on the website.

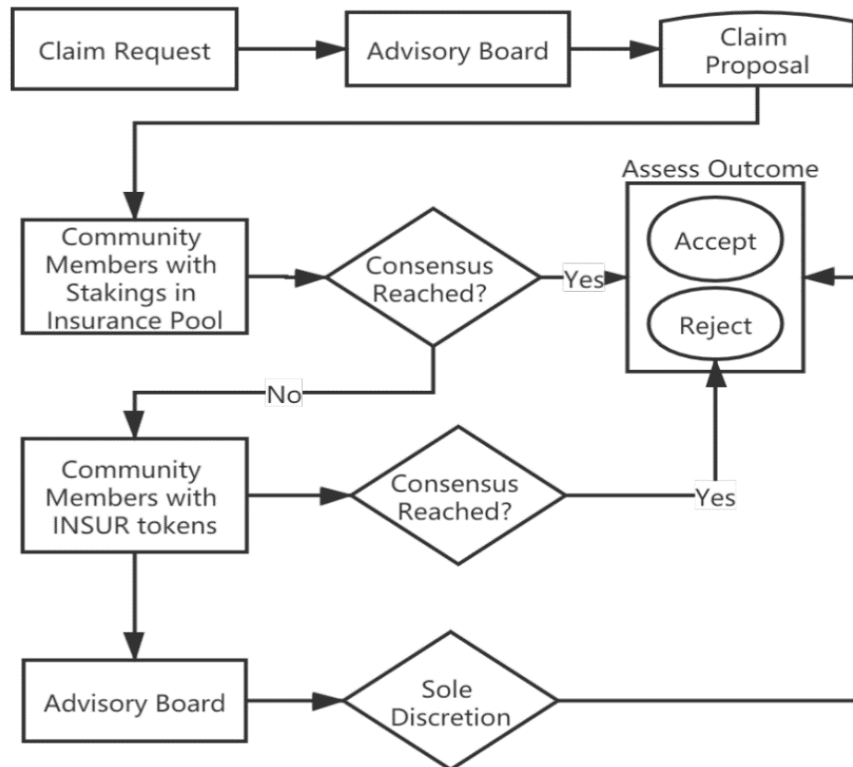

Figure 11 Claim Assessment Process

4.9 Governance

InsurAce will adopt the DAO governance mechanism commonly deployed in DeFi projects nowadays with INSUR as the governance token for voting and incentive purposes. The principles for InsurAce governance are:

- Security of the capital that members deposit is at the highest priority. Use, movement, investment and/or any other key change to member capital shall be decided by the community;
- The day-to-day operations of the InsurAce platform shall not be impacted even without community involvement;
- Encourage maximum community participation in the key area changes such as business design, product listing/delisting, feature addition/removal, technology evolvement, version releases and etc.
- In the event when community governance fails, there should be contingency procedures in place as the fall back plan to form a complete waterfall.

The governance framework will comprise of 2 approaches:

- Community Voting. Where there is any new proposals, the community can vote for or against the proposals until consensus is reached.
- Advisory Board, consists of InsurAce employees as well as 3rd-party independent advisors with technical, insurance, compliance and/or other required expertise. They work as the oversight committee to set certain rules, review the community proposal, as well as executing contingency plan when the community voting mechanism fails.

The fundamental voting mechanism is that the INSUR token shares held stands for the voting rights with a cap per member set to avoid the concentration risk. The voting outcome will be based on factors such as the quorum, majority, voting right weightages, and etc.

The general process for community proposal handling are:

- 1) Proposal Raise: participants of InsurAce protocol to raise the proposal.
- 2) Advisory Board Preview: the Advisory Board to review the proposal first with their expertise, provide their comments as reference for community, set the incentives for the proposal, define the default outcome should voting fails, etc.
- 3) Member Vote: members vote for or against the proposal in which INSUR token lock-up might be needed, and conclude with a definite outcome.
- 4) Execution: InsurAce project team and community contributors work together to implement the proposals and disclose with transparency accordingly.

We hope to build InsurAce as a secure and fair platform by the community, of the community, and for the community.

4.10 Cross-Chain Coverage

With the expansion of DeFi ecosystem, DeFi protocols built on other public blockchain such as TRON, EOS are also booming. InsurAce will firstly provide coverage to those non-Ethereum DeFi projects, providing coverage for the whole DeFi community. Along the way, we will also explore technical integrations with other public blockchains to grow with the whole ecosystem.

4.11 Ecosystem

InsurAce will collaborate with the DeFi projects that are insured to build an ecosystem where InsurAce clients or INSUR holders will enjoy the benefits of those platforms. For example, InsurAce users will be granted special incentives on insurance, lending, DEX, and other protocols in collaboration with InsurAce.

5 Token Economy

The InsurAce platform will issue standard ERC20 token, INSUR, as the governance and utility token to incentivize the participants in the ecosystem in a retroactively manner. The supply and allocation plan for INSUR is designed as such:

- Total supply: 100M INSUR
- The distribution plan for the tokens are as shown table below.

Token Distribution	Token%	Token Amt.	Vesting Terms
Seed Round	10.75%	10,750,000	15% unlock upon token generation event (TGE), linear vesting / block over 2 years for the rest starting from the 3 rd month after TGE
Strategic Round	9.25%	9,250,000	[Prices and Terms to be finalized]
Team & Advisors	15%	15,000,000	5% unlock upon TGE, linear vesting / block over 2 years for the rest starting from the 3 rd month after TGE
DAO Reserves	15%	15,000,000	Reserved for liquidity provision on exchange listing, marketing initiatives, developer grants, strategic partnership, and long-term development of the platform
SCR-Mining Reserves	50%	50,000,000	In accordance with the SCR mining schedule.

Table 3 Token Distribution Plans

The INSUR tokens can be used in below scenarios:

- Mining incentives for capital provisions to the insurance pool and investment products;
- Representation of voting rights in community governance scenarios such claim assessment, proposal voting and etc.;
- Eligible for fees generated by InsurAce protocol through governance participation;
- Community incentives;

6 Transparency

As a mutual based insurance platform, it bears in its nature to disclose the necessary information to participants, partners and other interested parties. Given the traceability and immutability of blockchain technology, all transaction data can be retrieved from the public distributed ledger, making the platform operations transparent. Meanwhile,

we will disclose information and data on our website in a timely manner, including but not limited to:

- Transaction data of insurance products;
- Key metrics of the capital model, such as the SCR, SCR%, staking pool size, etc.;
- Parameters of the pricing models;
- Investment plans, executions and P/L;
- Platform operational cost and income;
- Claim process and executions;
- Community proposals and governance;
- Liquidity mining operation details;
- Token issuances, consumptions and distributions.

With these information publicized on the website, we aim to maintain a transparent and sustainable ecosystem where the platform can provide insurance covers to the whole crypto space. In the event when any inaccuracy or misinformation occurs, the InsurAce platform will respond timely to ensure the transparency of the whole community.

7 Network Security

The DeFi applications have been constantly exposed to cyber security risks which is what InsurAce intends to resolve via fine designed insurance products. As a fundamental risk management platform for the whole DeFi ecosystem, the security for InsurAce platform per se will be more critical than any other applications. To build a highly secure and resilient protocol, we will adopt the best practices in the industry, such as:

(1) Smart contract audits

We will invite 3rd party independent audit company to audit the smart contracts of InsurAce, to detect, identify and eliminate the potential contract vulnerabilities through rigorous code review, testing and white-hat hacking prior to the protocol launch. The audit reports will be released to the public.

(2) Deploy up-to-date security solutions

There are security solutions to monitor the health status of the network, on-chain activities, oracle dependencies, admin key details, etc., which will be adopted by InsurAce to surveil and enhance the platform security.

(3) Develop effective security incident response process

With the implementations of the above security controls, it is equally important to establish a process on how to properly respond to cyber security incidents. In the event

when a security breach occurs, the InsurAce security team will respond timely with contingency plans, such as:

- Suspend or terminate partial or all functions of smart contracts;
- Add a pending session to some suspicious and large transactions;
- Revert suspicious transactions and trace back the root cause;

Overall, it is never overstated to enhance the platform security capabilities. With InsurAce as a secure and resilient insurance protocol, the whole DeFi community will also be benefited in the long run.

8 Legal and Compliance Framework

Given the decentralized nature and nascent status quo of DeFi, the operators and/or participants of DeFi network may be exposed to legal and regulatory uncertainties as the existing statutory and compliance interpretations may not be up-to-date to address the emerging challenges. Nevertheless, InsurAce will carefully examine the existing applicable laws and regulations as well as stay tuned to latest updates to ensure full compliance with relevant legal and compliance jurisdictions.

9 Roadmap and Future Development Plans

We foresee that the development of InsurAce platform is a systematic project that requires persistent efforts and continuous improvements, which will be rolled out according to plans below for the 1st year.

Q4 2020

- Platform design and prototype protocol development.
- Community building.
- Launch of InsurAce v1.0, including the portfolio based insurance products, capital pools, SCR mining, investment portal, claim assessment and governance.
- Private token sales.

Q1 2021

- Launch of InsurAce v2.0, to include the cross-chain DeFi protocol covers, enhancement to investment planning and implementations, continuous optimization of pricing models.
- Explore collaborations with other DeFi protocols.

Q2 2021

- Launch of InsurAce v3.0, to include insurance coverage marketplace, continuous enhancements to existing products and models, more collaborations

with other DeFi protocols in the ecosystem

Q3 2021

- Diversify the product line to cover more risk types, such as oracle malfunction, asset volatility, flight delay, disaster and etc.
- Explore cross-chain technical integrations with other public BlockChains.
- Continuous enhancements to platform operations and expansion of market shares.

10 Conclusion

With the above designs and value propositions, we are committed to build the InsurAce platform as an infrastructure for the whole DeFi community, and provide easy access, cost efficient, as well as fine governed insurance service to the millions of users in the digital era.
